

Week 9 Lab Reflection

- 1. In composite pattern we took safety option by having all operations throw 'UnsupportedOperationException' by default. This helped us prevent misuse (like having menu item accidentally having children added to it, and runtime errors are caught immediately rather than producing incorrect behaviour or failing silently.**
- 2. State Pattern choice: with conditionals, the order lifecycle logic would look scattered between many methods, and adding new states would require touching them. With state pattern encapsulated logic we achieve different achievements such as polymorphism where states respond differently to different actions (like new state.deliver is no while ready state.deliver is okay). Also to add new states we won't have to touch existing code and simply create new class implementing the interface.**
